

METHOD AND APPARATUS FOR DISPLAYING INFORMATION IN A DISPLAY SCREEN REGION IDENTIFIED BY PERMANENT PRINTING

ABSTRACT

5 A method and system for displaying information on a hand held computer system in a display region identified by permanent printing. The hand held computer system may comprise a second display region, separate from the first display region located in the permanent printing region. Independent streams of information may be displayed on the separate display regions. Alternatively, the
10 second display region may be a different region of a single display unit. The display region can display any type of information, e.g., alert information, clock information, phone messages, pager messages, etc. Display of information in the display region does not interfere with the second display region.
